

The **Xtender Battery Regenerator** is an all-in-one, fully automated machine for safely **discharging**, **desulfating**, and **recharging** lead-acid batteries. The Xtender uses a high-frequency pulsation process to breakdown lead sulfate crystals to restore lost battery capacity.

Features

- Three phase input
- Restores batteries between 2 V-96 V
- Individual battery analysis
 - Individual cell analysis available with the addition of the BMS
- Control and monitor system remotely
- Restorative Shark Pulse technology
- Customizable detailed battery performance reports
- Customizable cycles
- Touchscreen programming
- Suitable for flooded lead-acid, AGM and gel traction batteries

Benefits

- Increase battery lifespan/run-time
- Minimize battery replacement costs
- No acid adjustment required
- Easy to use and operate (can be left unattended)

The **Battery Monitoring System (BMS)** is designed to provide accurate data on the health of individual battery cells. Data from up to 100 cells is simultaneously collected by the sensors and transferred to a wireless receiver. The wireless receiver communicates the data to a PC. It is easy to determine which cell needs replaced with the proprietary software. Use the **BMS** in conjunction with the **Xtender Battery Regenerator** to improve the health of your battery.

Features/Benefits

- Available in 2 V, 6 V and 8-12 V
- Suitable for various industries
- Complete battery evaluation
- Printable results for record keeping
- Software and updates included

BMS Sensors	2 V
M1007 Kit	24*

*Additional sensors available for purchase
